

# *ORDBMS: OR Features of Oracle*

Excerpt from  
Oracle Documentations by Mehdi Sharifzadeh

# History of Oracle database

- ❖ In 1979, Oracle Version 2 introduced
  - An early commercial relational database system.
- ❖ In 1997, Oracle Version 8 released
  - Support for object-oriented development and multimedia applications.
  - Object-Relational DBMS
- ❖ In 1999, Oracle 8i released
  - Tuned with the needs of the Internet/Web
- ❖ In 2001, Oracle 9i released
  - Include the facility to read and write XML documents
- ❖ In 2003, Oracle 10g released
  - Support for Grid Computing
- ❖ In 2007, Oracle 11g released
  - Support for Linux and Windows

# *Object-Relational Elements in Oracle 10g*

- ❖ Object-Oriented Concepts
- ❖ Objects
- ❖ Methods
- ❖ Object Tables
- ❖ Type Inheritance
- ❖ Collections

# Object-Oriented Concepts: ADTs & Objects

- ❖ **Abstraction and Encapsulation** (Provided by Abstract Data Types (ADT))
  - **Abstraction** is the process of identifying the essential aspects of an entity and ignoring the unimportant properties. Focus on what an object is and what it does, rather than how it should be implemented.
  - **Encapsulation** (or information hiding) provides data independence by separating the external aspects of an object from its internal details, which is hidden from the outside world.
- ❖ **Objects**
  - **Object** is a uniquely identifiable entity that contains both the attributes that describe the state of a real-world object and the actions that conceptualize the behavior of a real-world object. The difference between object and entity is that object encapsulates both state and behavior while entity only models state.
  - **Attributes** (or instance variables) describe the current state of an object (the notation for attribute: object-name.attribute-name).

# Object-Oriented Concepts: Methods and Classes

- ❖ **Methods:** define the behavior of the object. They can be used to change the object's state by modifying its attribute values, or to query the value of the selected attributes. A method consists of a name and a body that performs the behavior associated with the method name (notation: object-name.method-name).

- ❖ **Classes:** A group of objects with the same attributes and methods. Hence, the attributes and the associated methods are defined once for the class rather than separately for each object.
- ❖ The *instances* of a class are those objects belonging to a class.

# Oracle Object Types

- ❖ User-Defined data types (classes)
- ❖ Consist of 2 parts: attributes + methods

```
CREATE TYPE person_type AS OBJECT (  
    name          VARCHAR2(30),  
    phone         VARCHAR2(20), -- attributes declared.
```

```
MEMBER FUNCTION get_areacode RETURN VARCHAR2 ); -- method
```

```
/ -- This slash needed to get Oracle process this statement.
```

```
--Defining an object type does not allocate any storage.
```

```
--The body of method is defined in a separate CREATE
```

```
--TYPE BODY statement, written in PL/SQL or any other languages.
```

```
DROP TYPE person_type;
```

```
--First drop all tables and other types using person_type.
```

# Oracle Objects

## ❖ Definition

- Actual instance of the defined object type,
- Storages are allocated to an object and values are assigned to the attributes of an object

```
CREATE TABLE contacts (  
    contact          person_type,  
    c_date           DATE );  
-- object type can be used like any other built-in data types.
```

```
INSERT INTO contacts VALUES (  
    person_type('Tommy Trojan', '213-740-1114'), -- instance  
    '24 Jan 2004' );  
-- person_type is instantiated and values are assigned to  
-- the attributes of the object instance.
```

# Oracle Methods

## ❖ What

- Functions/procedures declared in the object type definition to implement behavior of the object of that type.
- Written in PL/SQL or virtually any other languages (Java, C...)

## ❖ Method types

- Member method
  - Defined on object instance's data.
- Static method
  - Invoked on the object type, not its instances.
  - Can be used to the operations that are global to the type (e.g. initialization)
- Constructor method
  - Built-in constructor function, like in C++.

# Oracle Methods: Member Method

- ❖ Member methods are used to access an object instance's values.

```
CREATE OR REPLACE TYPE BODY person_type AS
  MEMBER FUNCTION get_areacode RETURN VARCHAR2 IS
  BEGIN
    RETURN SUBSTR(phone, 1, 3);
  END get_areacode;
```

```
END;
```

```
/
```

```
-- Define the body of the method using CREATE OR REPLACE TYPE BODY.
```

```
SELECT c.contact.get_areacode()
FROM contacts c;
-- Invoke a member method
```

```
C.CONTACT.GET_AREACODE( )
```

---

*213*

# Oracle Methods: Constructor Method

- ❖ Every object type has a constructor method implicitly defined by system.
- ❖ Returns a new instance of the user-defined object type and sets up the values of its attributes.
- ❖ The name of constructor method is the same as the name of the object type.

```
p = person_type('Scott Tiger', '321-123-1234');
```

```
--Built-in constructor method, person_type(att1, att2) is invoked  
--to create a new object instance of person_type, specify values  
--for its attributes(name, phone), and set the object into a  
--variable p.
```

```
INSERT INTO contacts
```

```
VALUES (person_type('Scott Tiger', '321-123-1234'),  
        '10 Feb 2004');
```

```
--Same thing occurs here.
```

# Oracle Object Tables

- ❖ Object Table: special type of table, each row represents an object

```
CREATE TYPE person_type AS OBJECT (  
    name    VARCHAR2(30),  
    phone   VARCHAR2(20) );  
  
/  
  
CREATE TABLE person_table OF person_type;  
INSERT INTO person_table  
    VALUES (person_type ('Scott Tiger', '321-123-1234'));  
SELECT VALUE(p) FROM person_table p WHERE p.name = 'Scott Tiger';  
-- Single-column table: each row is a person_type object  
-- Perform object-oriented operations
```

- ❖ Comparing to a relational table

```
CREATE TABLE person_table (  
    name    VARCHAR2(30),  
    phone   VARCHAR2(20) );  
INSERT INTO person_table  
    VALUES ('Tommy Trojan', '213-740-1212');  
SELECT name, phone FROM person_table;  
-- Multi-column table: treat person_table as a relational table
```

# Methods to Compare Objects: Map Methods

- ❖ Define a special kind of member methods to compare objects.
- ❖ Define either a *map method* or an *order method* in an object type.
  - Map Method
    - Map object instances into one of the scalar types DATE, CHAR, NUMBER,...

```
CREATE TYPE circle_type AS OBJECT (  
    x          NUMBER,  
    y          NUMBER,  
    r          NUMBER,  
    MAP MEMBER FUNCTION get_area RETURN NUMBER );  
  
/  
CREATE TYPE BODY circle_type AS  
    MAP MEMBER FUNCTION get_area RETURN NUMBER IS  
    BEGIN  
        RETURN 3.14 * r * r;  
    END get_area;  
END;  
  
/  
SELECT * FROM circles c  
ORDER BY VALUE(c);    --Result should be ordered by circles' area
```

# Methods to Compare Objects: Order Methods

## ■ Order Method

- Provides direct object-to-object comparison, telling that the current object is less than, equal to, or greater than the other object.

```
CREATE TYPE circle_type AS OBJECT (  
    x                NUMBER,  
    y                NUMBER,  
    r                NUMBER,  
    ORDER MEMBER FUNCTION match(c circle_type) RETURN INTEGER ); /
```

```
CREATE OR REPLACE TYPE BODY circle_type AS  
    ORDER MEMBER FUNCTION match (c circle_type) RETURN INTEGER IS  
    BEGIN  
        IF r < c.r THEN    --  $3.14*r^2 < 3.14*c.r^2$   
            RETURN -1;    -- any negative number  
        ELSIF r > c.r THEN  
            RETURN 1;    -- any positive number  
        ELSE  
            RETURN 0;  
        END IF;  
    END;  
END; -- returns only one integer value among positive, 0, and negative.
```

# Example

```
CREATE TABLE circles OF circle_type;

INSERT INTO circles VALUES (circle_type(10, 10, 3));

INSERT INTO circles VALUES (circle_type(40, 20, 8));

INSERT INTO circles VALUES (circle_type(10, 50, 4));

SELECT c.x, c.y
FROM circles c
WHERE VALUE(c) < (circle_type(40, 25, 5)) ;
```

# Object-Oriented Concepts: Specialization

- ❖ **Subclass:** A class of objects that is defined as a special case of a more general class (the process of forming subclasses is called *specialization*).
- ❖ **Superclass:** A class of objects that is defined as a general case of a number of special classes (the process of forming a superclass is called *generalization*). All instances of a subclass are also instances of its superclass.
- ❖ **Inheritance:** By default, a subclass inherits all the properties of its superclass (or it can redefine some (or all) of the inherited methods). Additionally, it may define its own unique properties.

# Object-Oriented Concepts: Inheritance

- ❖ *Single inheritance:* When a subclass inherits from no more than one superclass.
- ❖ *Multiple inheritance:* When a subclass inherits from more than one superclass (note: a mechanism is required to resolve conflicts when the Superclasses have the same attributes and/or methods). Due to its complexity, not all OO languages and database systems support this concept.
- ❖ *Repeated inheritance:* A special case of multiple inheritance where the multiple Superclasses inherit from a common superclass (note: must ensure that subclasses do not inherit properties multiple times).

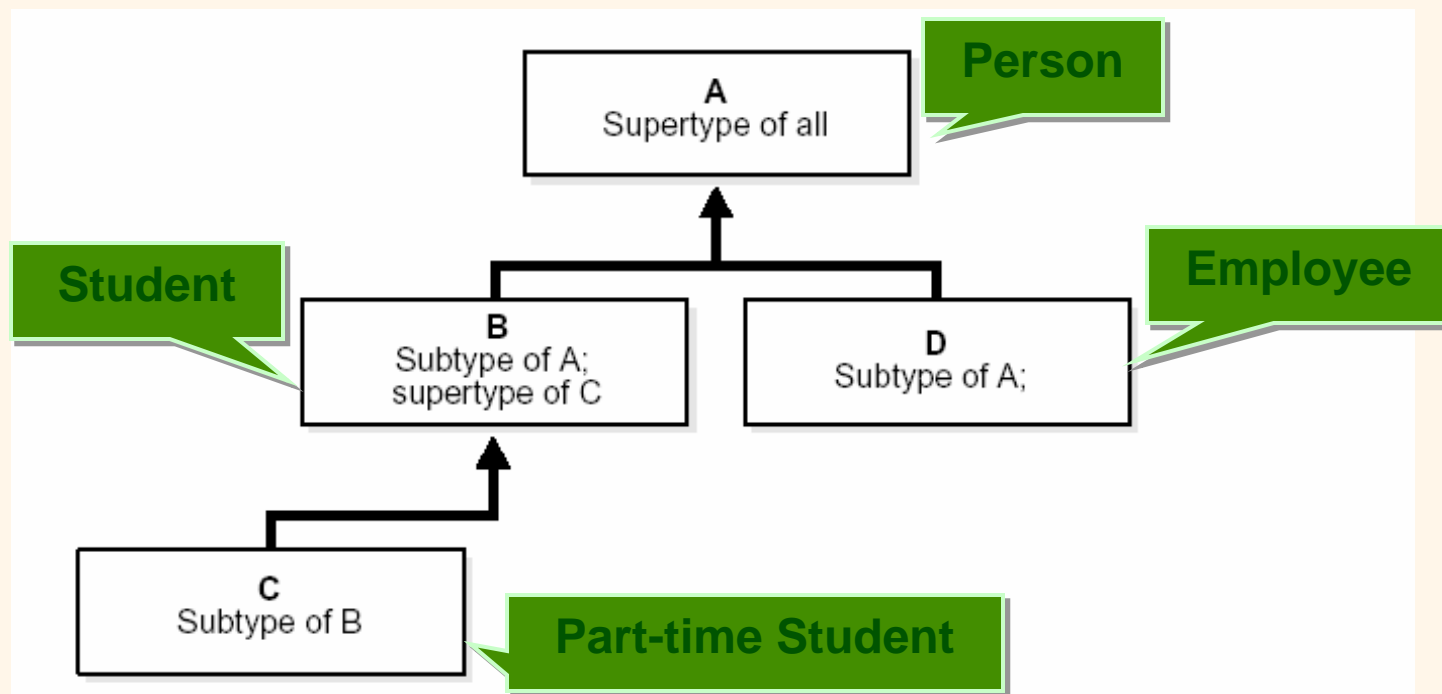

# Oracle Type Inheritance

## ❖ Supertype/Subtype

- Subtype is derived from a parent object type, Supertype.
  - Subtype inherits all attributes and methods from its supertype.

## ❖ Example

# Oracle Type Inheritance: Example

```
CREATE OR REPLACE TYPE person_type AS OBJECT (  
    ssn          NUMBER,  
    name        VARCHAR2(30),  
    address     VARCHAR2(100)) NOT FINAL; /
```

```
--To permit subtype, object type should be defined as NOT FINAL.  
--By default, an object type is FINAL
```

```
CREATE TYPE student_type UNDER person_type (  
    deptid      NUMBER,  
    major      VARCHAR2(30)) NOT FINAL; /
```

```
CREATE TYPE employee_type UNDER person_type (  
    empid      NUMBER,  
    mgr        VARCHAR2(30)); /
```

```
CREATE TYPE part_time_student_type UNDER student_type (  
    numhours   NUMBER ); /
```

# Oracle Type Inheritance: Use Case

```
CREATE TABLE persons OF person_type;
```

```
INSERT INTO persons VALUES (student_type(123, '213-740-2295', 'PHE-306', 1, 'John'));
```

```
INSERT INTO persons VALUES (employee_type(789, '213-821-1739', 'PHE-330', 888, 'Farnoush'));
```

```
SELECT * FROM persons;
```

```
SELECT VALUE(p) FROM persons p WHERE VALUE(p) IS OF (employee_type);
```

```
SELECT TREAT(VALUE(p) AS student_type).major FROM persons p WHERE VALUE(p) IS OF (student_type);
```

# Oracle Type Inheritance: Overriding

## ❖ Overloading/Overriding methods

```
CREATE TYPE Shape_typ AS OBJECT (...,  
    MEMBER PROCEDURE Enlarge(x NUMBER),  
    ...) NOT FINAL; /  
CREATE TYPE Circle_typ UNDER Shape_typ (...,  
    MEMBER PROCEDURE Enlarge(x CHAR(1))); /  
--Define the inherited method Enlarge() to deal with different types of  
--input parameters.
```

```
CREATE TYPE Shape_typ AS OBJECT (...,  
    MEMBER PROCEDURE Area(),  
    FINAL MEMBER FUNCTION id(x NUMBER)...  
) NOT FINAL; /  
CREATE TYPE Circle_typ UNDER Shape_typ (...,  
    OVERRIDING MEMBER PROCEDURE Area(),  
    ...); /  
--Redefine an inherited method Area() to make it do something different  
--in the subtype.
```

# Oracle Collections

## ❖ Set of data elements

- VArray - ordered set of data elements.

```
CREATE TYPE phones AS VARRAY(3) of VARCHAR2(20); /  
--Each element has an index, corresponding to its position in  
--the array
```

- Nested Table - unordered set of data elements

```
CREATE TYPE people_type AS TABLE OF person_type; /  
--Declare the table type used for a nested table.
```

```
CREATE TABLE contacts (  
    contact        people_type,  
    c_date         DATE )  
    NESTED TABLE contact STORE AS people_table;  
--Declare a nested table
```

# Oracle Collections: Inserting/Querying

```
INSERT INTO contacts
VALUES (people_type(person_type('Tommy Trojan', '213-740-1234'),
                        person_type('Scott Tiger', '321-123-1234')),
        '12 Feb 2004');
```

```
SELECT * FROM contacts;
```

```
CONTACT(NAME, PHONE)                                C_DATE
-----
PEOPLE_TYPE(PERSON_TYPE('Tommy Trojan', '213-740-1234'), PERSON_TYPE('Scott
Tiger', '321-123-1234'))                            12-FEB-04
```

```
SELECT p.phone, c.c_date FROM contacts c, TABLE(c.contact) p;
```

```
PHONE                C_DATE
-----
213-740-1234        12-FEB-04
321-123-1234        12-FEB-04
```

```
SELECT p.phone FROM TABLE(SELECT c.contact FROM contacts c) p;
-- result(?)
```
